Observational Provincial Evaluation of iOAT & TiOAT SUMMARY

Between 2018 and 2023, we conducted 600 interviews of adults across BC with a history of injection drug use who were clinically eligible for injectable opioid agonist treatment (iOAT) or tablet-based iOAT (TiOAT). Our goal was to evaluate outcomes related to iOAT/TiOAT. This is what we learned:

What were TiOAT program strengths?

Options for take-home doses

Positive relationships, individualized care

Social connections

Safe, friendly treatment environments

Integrated services & referrals

What are ways to improve TiOAT programs?

Stronger doses, faster titration

Lower-threshold delivery

Facilitating connections with heath & social services

Longer operating hours

What are positive impacts of TiOAT?

Reductions in drug use

Improved health

Reduction in precarious income generation

Improved social connections

Reduced interactions with police

Reduce spending on drugs

Reduced overdoses

"They also had the program set up where we could go and do garbage pickup and needle pickup. And we'd be paid cash or gift cards for doing that ... So, it's nice that they provided all these opportunities as well."

[TiOAT Participant]

"Some of the staff there, some of them seen me quit before and stay clean for three years so they already know I can do it. They're encouraging and positive and yeah, definitely, it's helpful."

[TiOAT Participant]

"I no longer have negative experiences with the police. You know, you're nervous when they come around. And they're there to help, right... We create our own destinies so to speak, so thinking positive and not negative is huge when it comes down to dealing with the police."

[TiOAT Participant]

"Yeah. I [am] a lot more positive and determined now more than ever... I'm going to clean up. I'm going to get a job. I'm going to marry this woman. I'm, like I'm going to win. So, I think the program's helped me with that."

[TiOAT Participant]
